PROFESSIONAL SUMMARY

Engineering student combining Python, AI integration, and full-stack development with a strong product and business mindset. Builds tools that investigate real operational problems, surface actionable insights from data, and automate workflows end-to-end. Applies first-principles reasoning to challenge assumptions and iterate rapidly based on measurable outcomes. Seeks roles where technical execution and business impact reinforce each other.

EDUCATION

Universitat Politècnica de València (UPV) September 2024 – Present

Bachelor's Degree in Telecommunications Engineering (in progress) — Valencia, Spain

- Relevant coursework: mathematical analysis, statistics, logic, programming, communication theory, hardware systems design.
- Self-directed learning: Python data stack (Pandas, Plotly, Dash, FastAPI), SQL, REST APIs, LLM integration, TypeScript, React, cloud deployment (Vercel, Supabase, and Netlify).
- English: fluent — reads, writes, and communicates proficiently in professional and technical contexts.

PROJECTS

Enterprise Knowledge Retrieval System (RAG-based AI)

April 2025

Python · TypeScript · JavaScript · HTML · LLM Integration · Semantic Search

- Investigated the problem of slow information retrieval in large document sets, identifying that manual keyword search averaged 20 minutes per query.
- Innovated by designing a retrieval-augmented generation (RAG) pipeline enabling natural-language queries over unstructured PDFs, integrating LLM APIs with a custom chunking and ranking system.
- Executed end-to-end: backend ingestion pipeline, semantic search layer, and frontend interface with cloud deployment.
- Reduced information retrieval time from 20 minutes to 30 seconds (97% reduction); iterated on chunking strategy and prompt design to improve answer precision.

Sales Decision Intelligence System

April 2025

React · TypeScript · Vite · Python (data processing) · Pandas · ETL Pipeline

- Investigated a manual sales reporting process consuming ~3 hours per week with a one-day lag in pricing decision data.
- Built an interactive real-time business intelligence dashboard with an automated ETL pipeline, replacing the manual workflow entirely.
- Designed configurable KPI views and alert logic to surface actionable insights and support faster pricing and product decisions.
- Eliminated weekly reporting overhead and enabled same-day decision-making; iterated on KPI selection and layout based on stakeholder feedback.

Market Intelligence & Decision Engine

April 2025

Python · TypeScript · CSS · Vercel · REST APIs · Pandas

- Investigated market data fragmentation across multiple external sources; designed a platform that ingests, processes, and analyses real-time market signals from multiple APIs.

- Implemented configurable alert systems to surface anomalies automatically, reducing manual monitoring and enabling faster data-driven decision-making.
- Deployed to Vercel with a full TypeScript frontend, iterating on alert thresholds and data refresh logic based on observed signal accuracy.

Intelligent Job Matching Engine

May 2025

Python · TypeScript · Supabase · SQL · Multi-factor Scoring Algorithm

- Designed and built a scoring-based recommendation system that evaluates candidate profiles against job listings using a custom multi-factor algorithm.
- Implemented a SQL-backed data layer (Supabase) to store and query candidate and listing data at scale, simulating real-world hiring platform architecture.
- Generated ranked matches with explainable scoring output, demonstrating end-to-end ownership from problem definition to deployed product.

SKILLS

Build	Python (advanced), FastAPI, REST APIs (requests lib), TypeScript (basic), SQL (intermediate), Git, React, Vercel, Supabase
Analyse	Pandas, ETL pipelines, exploratory data analysis, KPI dashboard design, Plotly, Dash
AI-Native	LLM API integration (OpenAI / Anthropic), prompt engineering, RAG systems, GitHub Copilot, Windsurf, AI-assisted workflows
Product	First-principles reasoning, data-driven prioritisation, experimentation mindset, end-to-end ownership, business model analysis, learning loop iteration
Languages	Spanish (native), Valencian (native), English (fluent), German (basic)

CORE COMPETENCIES

First-principles reasoning	Data-driven decision-making	End-to-end execution
RAG & LLM integration	Product experimentation	Business model thinking
ETL pipeline design	Iterative problem-solving	AI-augmented workflows

ACTIVITIES & INTERESTS

- Academic debate league — structured argumentation, rapid synthesis of complex information, and reasoning under time pressure.
- Chess — strategic planning and pattern recognition under constraints; iterating strategy based on new information.
- Reading — business strategy, product management, and technology non-fiction; strong interest in how digital products model, measure, and drive growth.
